'Wireless Broadband'

October 2004

Wireless broadband (formally: wide-area mobile broadband) is the technology to let you connect to high-speed Internet wherever you go.

Imagine your Desktop Computer is your ordinary home phone, your wireless equipped laptop as the cordless phone. Then wireless broadband is your mobile phone.

Sydney – city of the world's first commercially available mobile wireless broadband network.

The other parts of the world are expected to launch wireless broadband in late 2005/2006.

In Sydney, there are two choices that you can pick to experience the future technology.
